Contents

Overview

The member product purchases sync is intended for usage in programs where product-level transaction details are stored. The provided data is intended to supply an external system with members' product-level purchase information with rank and quantity in order to make it easier for analyzing which products that members purchase the most. This sync is a hybrid in terms of being cumulative and incremental.

With each sync execution, all members associated to a transaction that has been posted since the last execution will be included in the file. For these members, their lifetime product-level transaction information will be included in the data.

Upon each execution, all current member information is extracted and the completed file is then FTP'd to the predetermined location.

Member Product Purchases Sync
